

A Service Sharing Platform for Hands-on Teaching and Learning in Engineering Education

Xinyue Guo, Zhengxu Zhu, Shuxuan Zhao, Chenlin Yu, Ray Y. Zhong*

- Introduction
- Traditional engineering education faces challenges in cultivating students' innovation and hands-on skills, especially with the rapid advancements in technology. Traditional teaching methods, such as lectures and lab sessions, are becoming insufficient to meet the demands of developing real-world problem-solving abilities in students.
 - This study proposes a service-sharing platform that integrates 3D printing with engineering education to enhance hands-on learning experiences and foster creativity.
 - The platform also emphasizes flexibility, interactivity, and independence, creating an engaging and dynamic learning environment tailored to students' needs.

- Objectives
- Build an online platform that combines 3D printing services with modern pedagogical approaches to enhance hands-on learning in engineering education.
 - Implement an intelligent booking system to allow students to schedule personalized 3D printing sessions and manage learning resources efficiently.
 - Foster creativity, flexibility, and interactivity in engineering education to improve student engagement. Create intelligent resource allocation strategies to maximize teaching resource utilization and enhance learning outcomes.

- Methodology
- **Platform Design:** The platform integrates a 3D printing booking system with online learning resources. Features include tutorials, real-time monitoring, and a user-friendly interface for personalized scheduling. The printing process consists of four steps: determining printing time, checking the schedule, registering user information, and starting the print.

Registration Form

Equipment

Printer 2

Expected Start Time

2024/10/18 14:10:00

Expected End Time

2024/10/18 14:10:00

Submit

STEP 1: Upload File

Upload the model file to the printer before the scheduled time and start the print job.

STEP 2: Check schedule

Check the printer schedule to make sure the printer is available at the scheduled time.

STEP 3: Check schedule

Check the printer schedule to make sure the printer is available at the scheduled time.

STEP 4: Review the model

Stop printing and review the model before the scheduled time ends, regardless of the printing result.

(a) On-line Registration

(b) 3D Printing Steps Demonstration

(c) Schedule check & appointment

(d) Printing visualization & monitoring

- **Queuing Model for Resource Allocation:** Total 3D printing service capacity (C) is determined by: $C = n \times t_{ave}$, where n = number of printers, and t_{ave} = average service time per print job. Capacity is divided into two parts: $C_r = \alpha \times C$, for reservations. $C_o = (1 - \alpha) \times C$, for walk-ins.

- **Pricing and Optimization:** Reservation price (P_r) includes a deposit (η) and a final payment ($P_r - \eta$). Walk-in price (P_o) is adjusted dynamically to manage demand and ensure fairness. The platform maximizes total service revenue (Φ) using: $\Phi = P_r \times \min(\lambda_r, C_r) + P_o \times \lambda_o$, where λ_r = arrival rate of reservation students, and λ_o = arrival rate of walk-in students.

Results

- **Scenario Analysis:**
 - Scenario I:* High Demand ($\lambda > C$) When total demand exceeds capacity, waiting time increases significantly: $\Omega \approx \lambda / \mu(\mu - \lambda)$ A higher deposit (η) is required to ensure reservation commitment. Reservation prices (P_r) and walk-in prices (P_o) increase to manage demand.
 - Scenario II:* Balanced Demand ($\lambda \leq C$) When demand matches capacity, the system operates stably, minimizing waiting time: $\Omega \approx \lambda / \mu$ A larger portion of capacity (α) is allocated to reservations, and walk-in queues are avoided.
- **Resource Utilization:** Utilization efficiency (U) is calculated as: $U = (\lambda_r \times t_{ave}) / (n \times t_{ave})$, where λ_r = reservation arrival rate.
- **Student Feedback and Engagement:** Real-time monitoring and personalized scheduling significantly improve student satisfaction. Reported outcomes include reduced waiting times and enhanced learning experiences.

Conclusion

- **Integration of Technology and Education:** The platform effectively integrates 3D printing with modern pedagogical approaches, addressing the challenges of hands-on teaching and learning in engineering education. Real-time feedback and personalized scheduling have enhanced the learning experience and improved teaching efficiency.
- **Enhanced Student Engagement and Learning Outcomes:** The platform fosters creativity and independence by allowing students to define their own printing tasks and observe the real-time printing process.
- **Contributions to Future Educational Practices:** This research provides a foundation for further exploration of technology-driven solutions in engineering education.
